

Finance Metrics Validator – Executive Summary

- Built a finance-focused SQL validation and reconciliation engine.
- Detects revenue risk patterns such as missing refund logic and status filters.
- Reconciles model output against ledger baseline using DuckDB.
- Returns structured JSON output for CI/CD gating.
- Packaged with CLI, automated tests, and dependency management.
- Designed for financial accuracy, auditability, and production readiness.

30-Second Pitch

I built a finance-oriented SQL validation and reconciliation tool that identifies common revenue-model risks and verifies totals against a ledger baseline. It integrates structured outputs, automated testing, and CLI-based CI gating to prevent financial misstatements from reaching production analytics environments.
